Hitachi WJ200 manual and quick reference:

http://www.hitachi-america.us/ice/inverters/products/ac_variable_speed_drives/wj200/

Software is available at no cost from the Hitachi website site:

http://www.hitachi-america.us/ice/inverters/support_service_sales/software_dloads

You must install BOTH the Then ProDriveNext (2.1.1) AND the USB driver software. The USB driver must be installed before connecting a computer to the VFD. With the WJ200 turned on and the USB cable connected to your computer, check in Windows under "Devices and Printers" the your Hitachi shows up in the pop up window. Then run the ProDriveNext software program.

1. The software is NOT intuitive until you have used it for awhile. When you load the software, click on the "File" tab at the top menu, then select "New Solution" each time when connecting to the VFD. Otherwise it tries to load old saved VFD files that are saved on your computer. There may be a way to edit them and download back to the VFD, but haven't been able to do this.

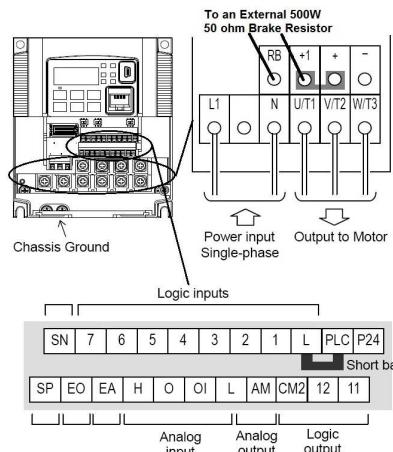

2. In the window tab "Add device" check the lower two check boxes, "Read Items....", then click the "Online&Read" button below. A pop-up screen should indicate that the VFD is on-line and connected, hit the OK button, and this will start the download of the VFD programmed parameters to the computer program.

3. In the left Toolbox pane you will see the VFD is connected. Click on the Parameter Data, a series of tabs and screen should come up in the right viewing pane. Note the series of Taps for each Parameter Group (F, A, B, C, H and P). Each Group Tab is a separate list of programmable functions, so you need to click on that tab to see the parameter group.

4. On any one Group Page, you can modify each parameter by clicking on the "Set Value" cell and entering the new numerical value. The parameter line will be highlighted with any changes you make, you can do one or many changes on multiple lines. Note: the value is not changed in the VFD memory until you either hit the "Program" tab at the top and select "Download (PC->Device), or you can place your cursor over the changed parameter, hit the "right" mouse key, and a pop-up menu will give you the same options. I recommend changing a few parameters, downloading them to the VFD and checking that everything is working. Then doing a few more within a group. Also for tweaking values once you get familiar with the effects.

5. There is a software Auto-tune motor function, used to determine your motor's parameters H031-H034 and then enter in the fields H031-H034. When you run it to optimize your motor parameters, write down the values and then enter your motor values in H031-H034. If control block terminals stop to function after auto-tune, check A001 and A002 are set to "01". They sometimes change when you run the VFD from the "Device Status" tab functions, like the "Basic inverter operation / IO status monitor" menu button.

6. The WJ200 may need to be programmed before it will work using the terminal commands and external speed control. Some of the software operated motor controls may change some of the VFD programming and it may stop responding to command (they change A001 and A002, so recheck these if the terminal block commands and external pot speed control stop working). Keep a hard copy of the program changes so you make. Be sure that the "Logic input" wiring connections match up with their assigned programmed functions "C001-C007".

Comments

Acceleration time of 5 seconds with an S acceleration curves works well

Requires external 50ohm 500W brake resistor for 1-2 second stop times

THIS MUST BE SET TO "01" IF YOU USE AN EXTERNAL POT CONNECTED TO TERMINALS "H, O & L" TO SET YOUR RPM SPEED CONTROL.

THIS MUST BE SET TO "01" IF YOU USE COMMANDS SENT TO THE VFD VIA CONTROL BLOCK TERMINAL "1-7", THIS MAY GET RESET TO "02" WHEN YOU DO THE MOTOR AUTOTUNE AND THE VFD WILL NO LONGER RESPOND TO THE TERMINALS, SO MAY NEED TO BE RESET BACK TO "02". WHEN SET TO "01" VFD RUN KEY WILL NOT WORK, ONLY STOP KEY.

SET TO MOTOR BASE FREQUENCY ON NAME PLATE, DEFAULT =60

Recommend 80 or 90 Hz for motors with a base frequency of 60 Hz

It is strongly recommended this is set to "31" if you use an external speed control, such as a wired speed pot. When set to "31" the VFD averages the pot readings and only allows changes above a 0.1Hz threshold. This reduces noise spikes picked up in the wiring going to the pot which cause RPM fluctuations when the pot is set to a fixed RPM setting.

F Group	Data ID	Data Name	Set value	Unit	Default value	Range		
	F001	Output frequency setting		0 Hz	0	0.00...80.00

IMPORTANT TO SET TO "03" Sensorless Vector for best performance

DO NOT CHANGE THIS, IT APPLIES TO A ELECTRO-MECHANICAL BRAKE

If set too high will get overvoltage error due to braking regeneration

Use the autotune feature to determine your motor's parameters H031-H034 and then enter in the fields below. I run the autotune feature through the software. Write down the values and then enter your motor values in H031-H034. If control block terminals stop to function after autotune, check A001 and A002 is set to "01"

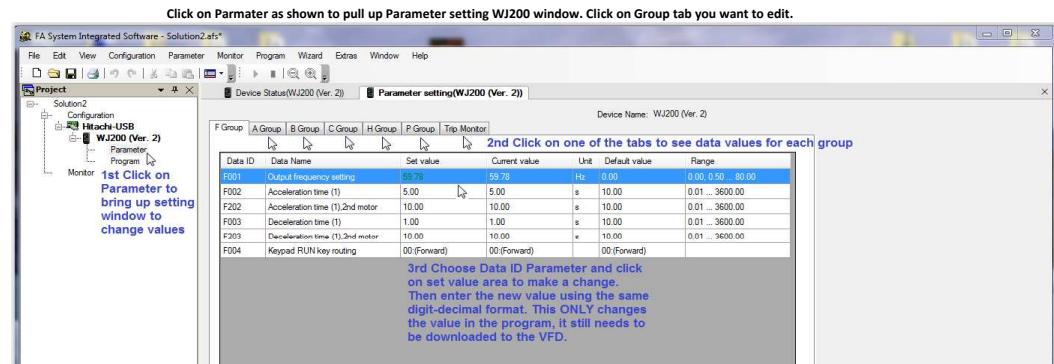

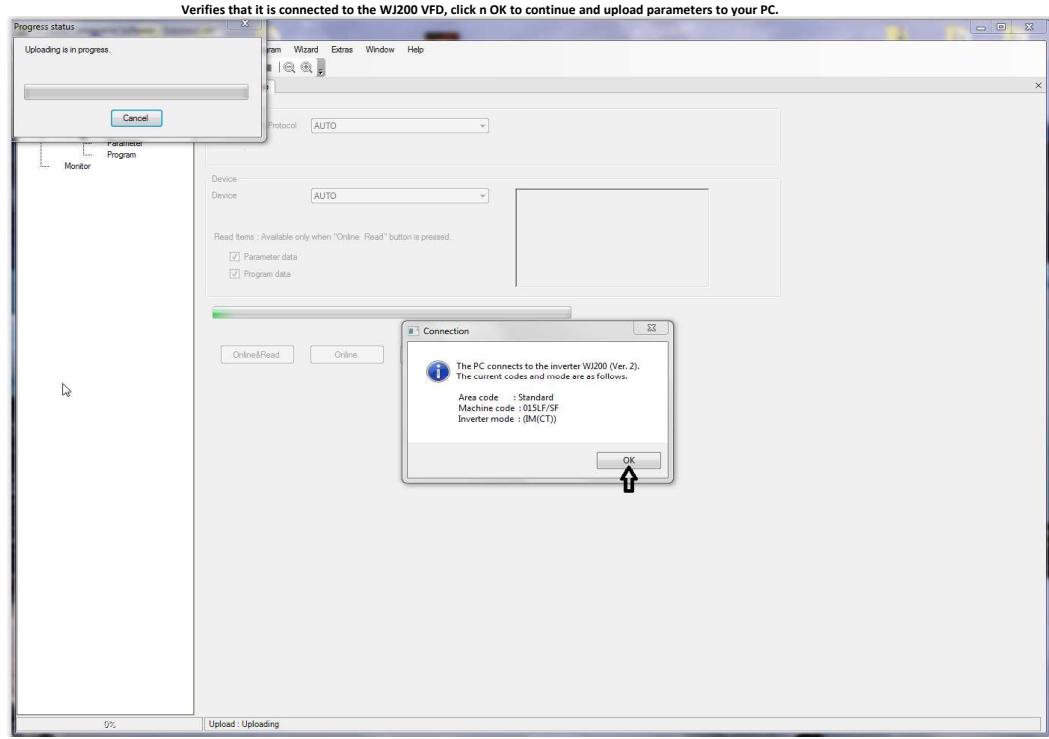

Run Hitachi VFD Software program, click on File and choose new project. Click to download Parameter and Program data and then click on Online&Read.

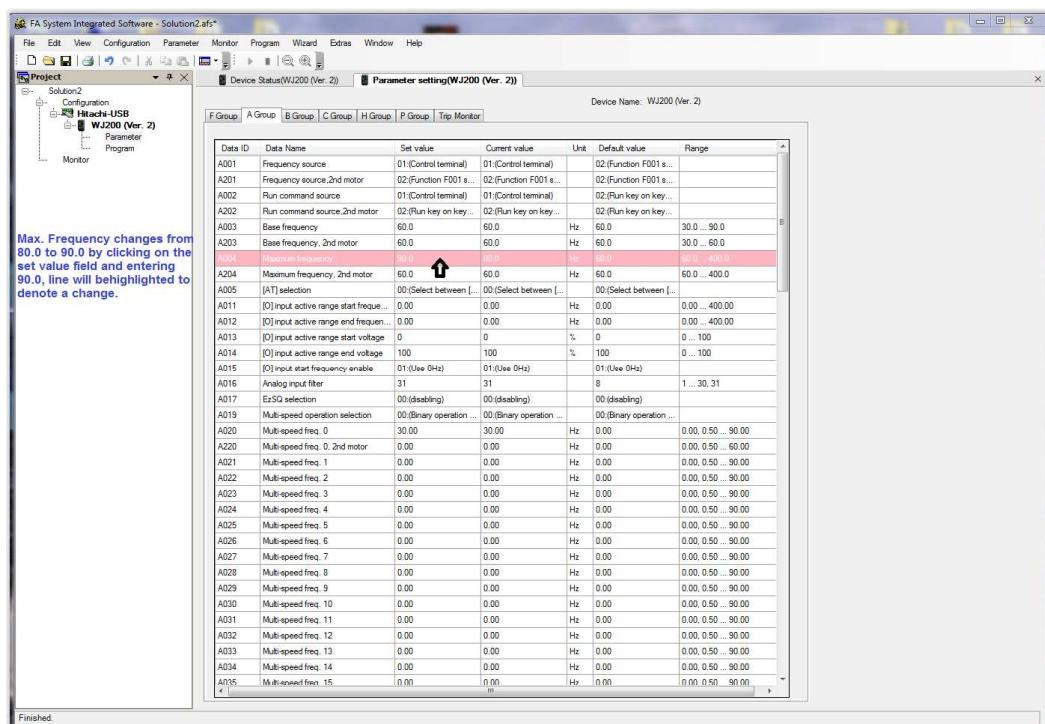

Indicates it is looking for the VFD and Data

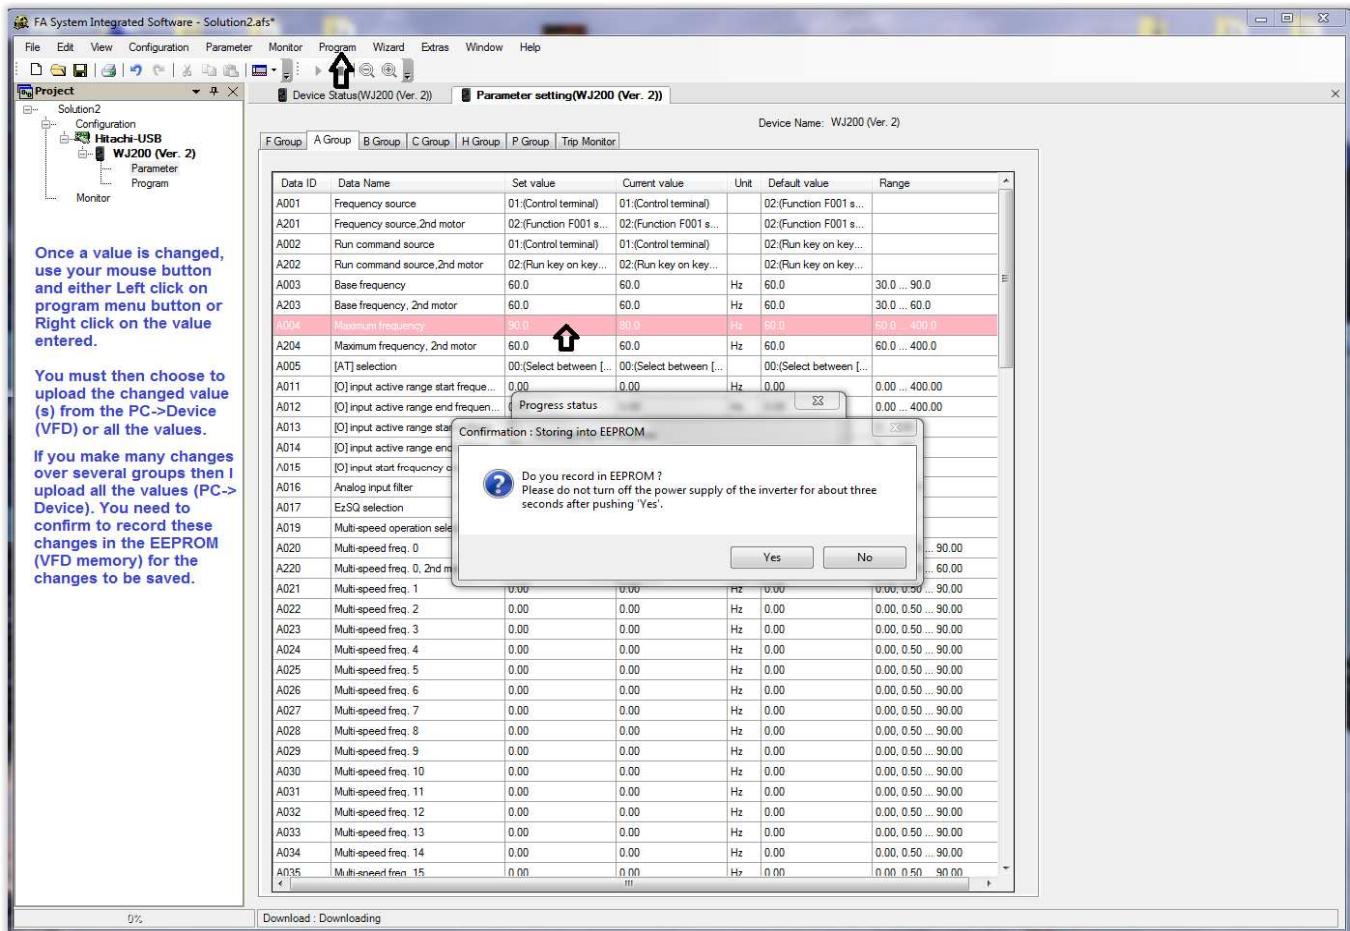

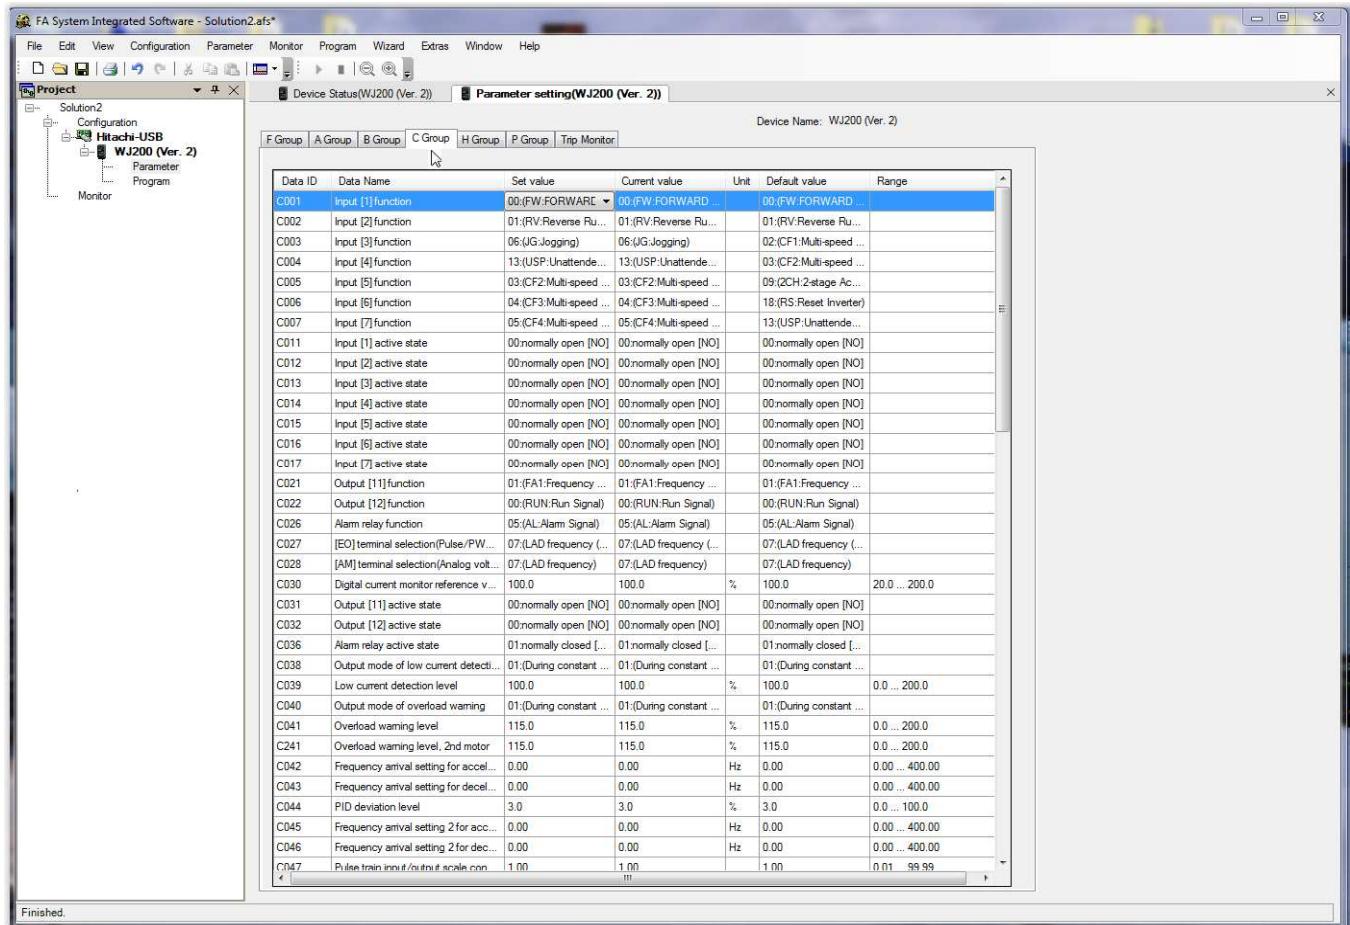

You make changes in the 'Set value' Column, the line(s) will be highlighted to indicate a change(s). The change(s) must then be sent to the VFD.

Program variable changes must be sent from the PC to the VFD, either Left click on the "Program" pull down menu tab, or Right click on the highlighted parameter to pull up the menu.

C Group Tab pulls up the program variables for the Input functions

Motor Auto-tune determines your motors actual operating parameters, which can be entered in the VFD program variables

1 Host PC WJ200 (Ver. 2)

Auto-tuning

Auto-tuning [WJ200 (Ver. 2)]-IM motor (Heavy duty)

After selecting a type of auto-tuning, please start the auto-tuning. Push the STOP key on the operator to stop the process.

Without motor rotation Motor does not rotate during auto-tuning. The motor constant (I_m-load current) and J (inertia) are not measured and remain unchanged. Please set these parameter manually after auto-tuning is finished.

With motor rotation Motor rotates according to a special operation. During auto-tuning, insufficient torque may cause a problem in the load (for example, a lift may slide down). In this case, remove the motor from the machine or other load, and perform auto-tuning with the motor alone. After auto-tuning, add the moment of inertia of the total machine to the measured data after converting the moment of inertia to the motor.

If the auto-tuning with motor rotation is used, check the following points:
 • The motor rotates up to 80% of base frequency. Check it is no problem for the application.
 • The motor should not be driven by any other external force.
 • All the brakes should be released.

Start/Retry

Auto-tuning status: Please refer to the display of the operator. Display: [Completed] (Completed) [Failed] (Failed)

Finish Back(B) Next(N) Cancel

Finished.

To use the motor Auto-tuning, Left click the mouse on the Device Status Tab. Then Left click on Auto-tuning. Enter the motor parameters (1000 RPM, motors are 4 pole). Hit Next(N) to go to the confirmation screen and to do a with or without motor rotation.

1 Host PC WJ200 (Ver. 2)

Auto-tuning

Auto-tuning [WJ200 (Ver. 2)]-IM motor (Heavy duty)

Precaution for auto-tuning

- Set appropriate capacity and number of pole.
- Set base frequency, maximum frequency and AVR voltage according to the motor specification.
- Proper motor constants are obtained only when a motor of the same size or one size lower than the inverter. If other size of motor is connected, a proper motor constants may not be obtained or auto-tuning operation may not be completed.
- During auto-tuning, DC braking setting (A051) and simple positioning selection (P012) are automatically disabled.
- When using ATR "Enable torque command input", please keep this signal OFF during auto-tuning.

Motor capacity(H003)	06(1.5) kW
Pole number setting(H004)	01(4P)
Base frequency(H003)	60.0 Hz (Range 30.0...90.0)
Maximum frequency(H004)	90.0 Hz (Range 60.0...400.0)
AVR voltage select(A082)	02(220) V
Vf gain(A045)	100 % (Range 20...100)
Dec. overvolt. suppress integral time(B134)	1.0 s (Range 0.5...150.0)

If the motor voltage is other than the alternatives, set Vf gain (A045) according to below formula:
 Motor voltage (A082) × Output voltage gain (A045) = Motor rated voltage
 When the motor voltage is higher than the alternatives, enable the overload restriction function, and set the overload restriction level to 150% of the rated current of the motor.
 When deceleration overvoltage suppress integral time (B134) is small, auto-tuning may result in over-voltage trip. In this case, increase B134 and retry the auto-tuning.

Finish Back(B) Next(N) Cancel

Finished.

When completed, hit the stop function key on the VFD and the Auto-tuning parameters will be displayed. Copy down the parameters and then enter the values under the parameter settings and then choose the "H" setting tab. Then choose the Function Codes to edit and enter the new motor values. When completed, save the changes from the PC-> Device.

VFD Main Power, Motor Wiring and External Braking Resistor Connections

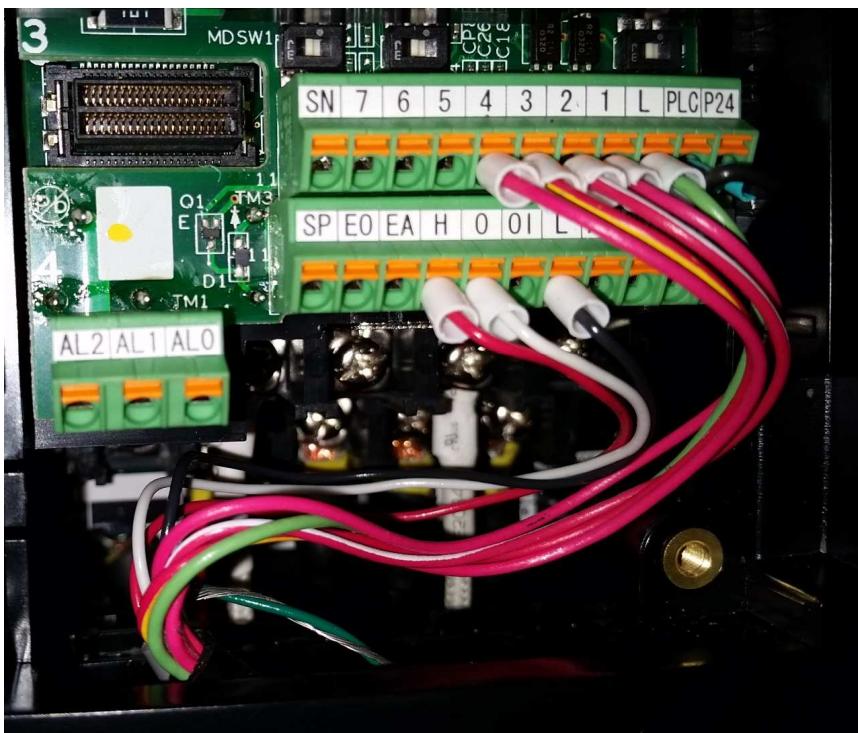

External 50ohm 500W Braking Resistor (for 2HP motor). Must mount to metal surface.

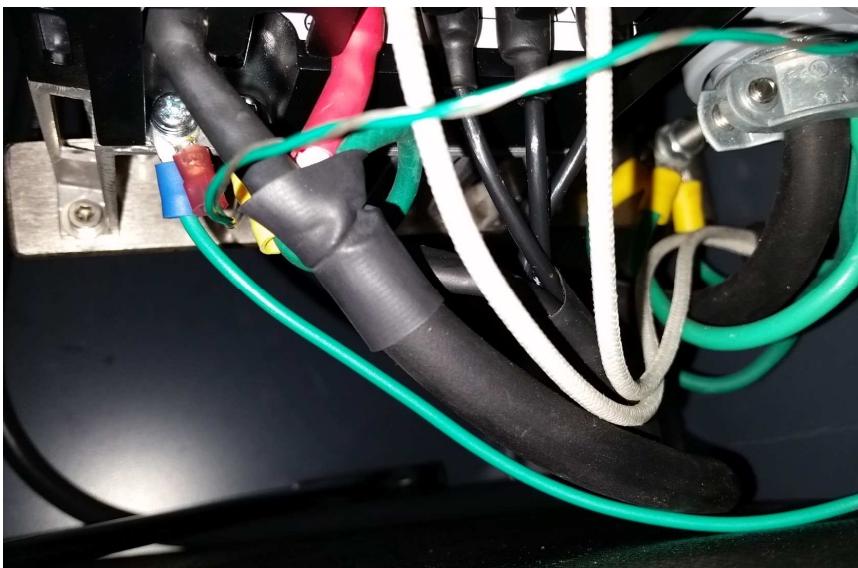

Example of Control Wiring at the Terminal Block. Note all cables have ground shields connected only at the VFD end.

NOTE: L, PLC & P24 CONNECTIONS VARY BASED ON APPLICATION. Connections for schematic are different than pictured here.

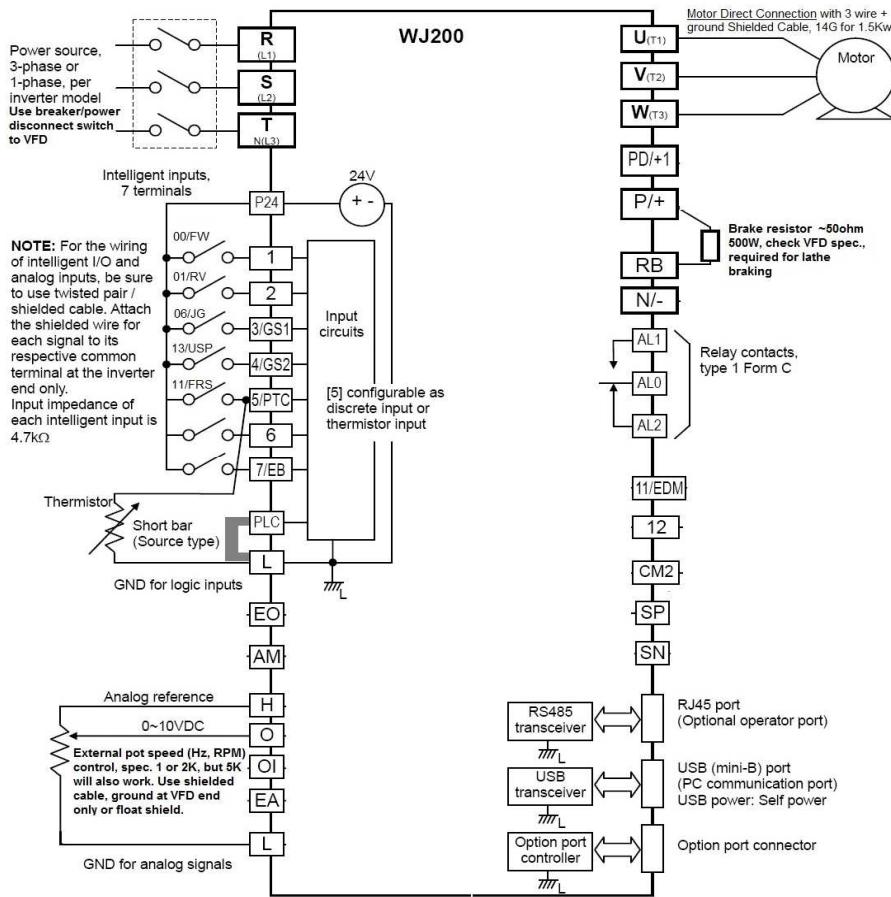

Use Star Grounding, Ground shields only at VFD end of cable.

Finished and Running
Main power switch controls all power, power lamp is through Jog Switch, Speed pot. Sets frequency/speed, MachTach speed indicator

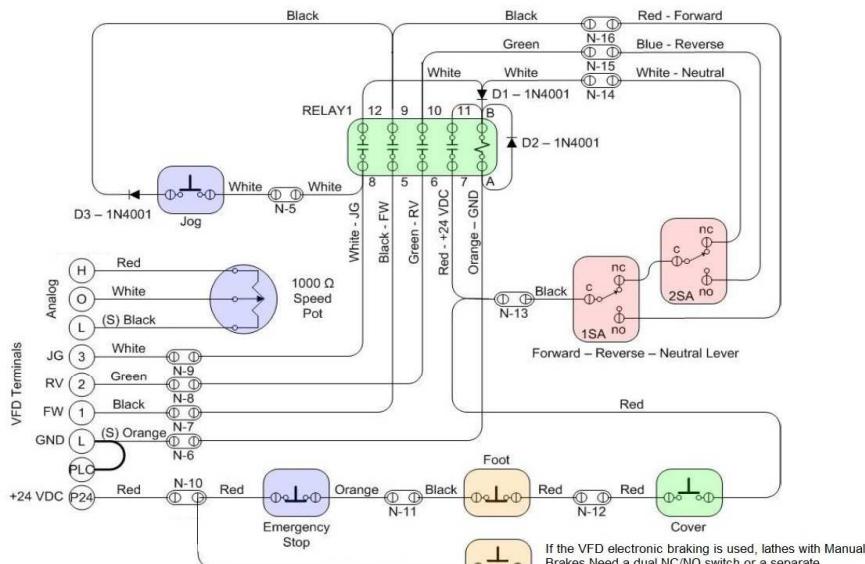

Abbreviated BASIC WJ200 Connection Diagram for connections to a 2HP lathe

Note: The factory schematic short bar is different than the shipped connections in the WJ200 VFD

*****NOTE: L, PLC & P24 CONNECTIONS AND SHORTING BAR JUMPER VARY BASED ON APPLICATION AND VFD. REVIEW INSTRUCTIONS AND CONNECT IN ACCORDANCE WITH YOUR APPLICATION*****

Adapted wiring diagram for PM1236 lathe using a single 24VDC 4 pole relay

Jumper is different based on application & VFD
Default WJ200 jumper is PLC to P24V
To use this schematic note the terminal wiring
Set jumper and connections accordingly

Note: +24 VDC P24 terminal used for VFD commands and powering single 24VDC relay, 100mA maximum current load

If the VFD electronic braking is used, latches with Manual Brakes Need a dual NC/NO switch or a separate Normally Open additional foot switch to send a free run command to a programmed analog terminal (use terminal 4 or 5). You cannot use a VFD electronic brake and a manual brake at the same time. Alternatively, you can disconnect the manual brake and use the foot switch as shown to just disconnect the For/Rev command and stop the lathe with the electronic brake only. Stopping times are similar, about 1 second.
